## Dual and Quad Micropower Single Supply Rail-to-Rail Input and Output (RRIO) Op Amp

## ISL28278, ISL28478

The ISL28278 and ISL28478 are dual and quad channel micropower operational amplifiers optimized for single supply operation over the 2.4 V to 5.5 V range. They can be operated from one lithium cell or two Ni-Cd batteries.

These devices feature an Input Range Enhancement Circuit (IREC) that enables them to maintain CMRR performance for input voltages $10 \%$ above the positive supply rail and to 100 mV below the negative supply. The output operation is rail-to-rail.

The ISL28278 and ISL28478 draw minimal supply current while meeting excellent DC-accuracy, AC-performance, noise, and output drive specifications. The ISL28278 contains a power-down enable pin that reduces the power supply current typically to $4 \mu \mathrm{~A}$ in the disabled state.

## Features

- Low-power 120~A Typical Supply Current (ISL28278)
- $225 \mu \mathrm{~V}$ Max Offset Voltage
- 30pA Max Input Bias Current
- 250kHz Typical Gain-bandwidth Product
- 105dB Typical PSRR
- 100dB Typical CMRR
- Single Supply Operation Down to 2.4 V
- Input Capable of Swinging Above V+ and Below V(Ground Sensing)
- Rail-to-rail Input and Output (RRIO)
- Enable Pin (ISL28278 Only)
- Pb-free (RoHS-compliant)

## Applications

- Battery- or Solar-powered Systems
- 4mA to 25mA Current Loops
- Handheld Consumer Products
- Medical Devices
- Thermocouple Amplifiers
- Photodiode Pre-amps
- pH Probe Amplifiers

BANDPASS AMPLIFIER (0.05Hz TO 159Hz)

| ISL28478FAZ | 28478 FAZ | -40 to +125 | 16 Ld QSOP | MDP0040 |

NOTES:

1. Add "-T7" suffix is for tape and reel. Please refer to TB347 for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and $100 \%$ matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb -free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for ISL28278 and ISL28478. For more information on MSL please see Tech Brief TB363.
4. Not recommended for new designs. For a possible substitute product, contact Intersil Technical Support Center at 1-888-INTERSIL or www.intersil.com/tsc.

## Applications Information

The ISL28278 and ISL28478 are dual and quad CMOS rail-to-rail input, output (RRIO) micropower operational amplifiers. These devices are designed to operate from a single supply ( 2.4 V to 5.5 V ) or dual supplies ( $\pm 1.2 \mathrm{~V}$ to $\pm 2.75 \mathrm{~V}$ ) while drawing only $120 \mu \mathrm{~A}$ (ISL28278) of supply current. This combination of low power and precision performance makes these devices suitable for solar and battery power applications.

## Rail-to-Rail Input

Many rail-to-rail input stages use two differential input pairs: a long-tail PNP (or PFET) and an NPN (or NFET). Severe penalties have to be paid for this circuit topology. As the input signal moves from one supply rail to another, the operational amplifier switches from one input pair to the other, causing drastic changes in input offset voltage and an undesired change in magnitude and polarity of input offset current.

The ISL28278 achieves input rail-to-rail without sacrificing important precision specifications and degrading distortion performance. The input offset voltage exhibits smooth behavior throughout the entire common-mode input range. The input bias current versus the common-mode voltage range has undistorted behavior typically from 100 mV below the negative rail and $10 \%$ higher than the $\mathrm{V}_{+}$rail ( 0.5 V higher than $\mathrm{V}_{+}$when $\mathrm{V}_{+}$equals 5 V ).

## Input Protection

All input terminals have internal ESD protection diodes to the positive and negative supply rails, limiting the input voltage to within one diode beyond the supply rails. There is an additional pair of back-to-back diodes across the input terminals. For applications in which the input differential voltage is expected to exceed 0.5 V , external series resistors must be used to ensure the input currents never exceed 5 mA (as shown in Figure 39).

FIGURE 39. INPUT ESD DIODE CURRENT LIMITING - UNITY GAIN

## Rail-to-Rail Output

A pair of complementary MOSFET devices are used to achieve the rail-to-rail output swing. The NMOS sinks current to swing the output in the negative direction. The PMOS sources current to swing the output in the positive direction. Both parts, with a $100 \mathrm{k} \Omega$ load, typically swing to within 4 mV of the positive supply rail and within 3 mV of the negative supply rail.

## Enable/Disable Feature

The ISL28278 offers two $\overline{\mathrm{EN}}$ pins ( $\overline{\mathrm{EN}} \_$A and $\overline{\mathrm{EN}} \_B$ ) which disable the op amp when pulled up to at least 2.0 V . In the disabled state (output in a high impedance state), the part typically consumes $4 \mu \mathrm{~A}$. By disabling the part, multiple parts can be connected together as a MUX. The outputs are tied together in parallel, and a channel can be selected by the $\overline{\mathrm{EN}}$ pins. The loading effects of the feedback resistors of the disabled amplifier must be considered when multiple amplifier outputs are connected together. The $\overline{\mathrm{EN}}$ pin also has an internal pull-down. If left open, the $\overline{\mathrm{EN}}$ pin pulls to the negative rail, and the device is enabled by default.

## Using Only One Channel

The ISL28278 and ISL28478 are dual and quad channel op amps. If the application requires only one channel when using the ISL28278 or fewer than four channels when using the ISL28478, the user must configure any unused channels to prevent them from oscillating. Unused channels oscillate if the input and output pins are floating, resulting in higher than
expected supply currents and possible noise injection into the channel being used. The proper way to prevent this oscillation is to short the output to the negative input, and ground the positive input (as shown in Figure 40).

FIGURE 40. PREVENTING OSCILLATIONS IN UNUSED CHANNELS

## Proper Layout Maximizes Performance

To achieve maximum performance from the high input impedance and low offset voltage of the ISL28278 and ISL28478, care should be taken in circuit board layout. The PC board surface must remain clean and free of moisture to avoid leakage currents between adjacent traces. Surface coating of the circuit board reduces surface moisture and provides a humidity barrier, reducing parasitic resistance on the board.

## Current Limiting

The ISL28278 and ISL28478 have no internal current-limiting circuitry. If the output is shorted, it is possible to exceed the absolute maximum rating for output current or power dissipation, potentially resulting in destruction of the device.

## Power Dissipation

It is possible to exceed the $+150^{\circ} \mathrm{C}$ maximum junction temperatures under certain load and power-supply conditions. It is therefore important to calculate the maximum junction temperature ( $T_{J M A X}$ ) for all applications, to determine whether power supply voltages, load conditions, or package type need to be modified to remain in the safe operating area. These parameters are related in Equation 1:

$$
\begin{equation*}
\mathrm{T}_{\mathrm{JMAX}}=\mathrm{T}_{\text {MAX }}+\left(\theta_{J A} \times \mathrm{D}_{\text {MAXTOTAL }}\right) \tag{EQ.1}
\end{equation*}
$$

where:

- $\mathrm{T}_{\text {MAX }}=$ Maximum ambient temperature
- $\theta_{\mathrm{JA}}=$ Thermal resistance of the package
- $P D_{\text {MAXTOTAL }}$ is the sum of the maximum power dissipation of each amplifier in the package ( $\mathrm{PD}_{\mathrm{MAX}}$ )

PD ${ }_{\text {MAX }}$ for each amplifier is calculated in Equation 2:

$$
\begin{equation*}
P D_{\text {MAX }}=2 * V_{S} \times I_{\text {SMAX }}+\left(V_{S}-V_{\text {OUTMAX }}\right) \times \frac{V_{\text {OUTMAX }}}{R_{L}} \tag{EQ.2}
\end{equation*}
$$

where:

- $\mathrm{PD}_{\text {MAX }}=$ Maximum power dissipation of one amplifier
- $\mathrm{V}_{\mathrm{S}}=$ Supply voltage (magnitude of $\mathrm{V}_{+}$and $\mathrm{V}_{-}$)
- ISMAX = Maximum supply current of one amplifier
- $\mathrm{V}_{\text {OUTMAX }}=$ Maximum output voltage swing of the application
- $\mathrm{R}_{\mathrm{L}}=$ Load resistance

## Application Circuits

## THERMOCOUPLE AMPLIFIER

Thermocouples are the most popular temperature-sensing device because of their low cost, interchangeability, and ability to measure a wide range of temperatures. The ISL28x78 (see Figure 41) is used to convert the differential thermocouple voltage into a single-ended signal with 10x gain. The amplifier's rail-to-rail input characteristic allows the thermocouple to be biased at ground and the amplifier to run from a single 5 V supply.

FIGURE 41. THERMOCOUPLE AMPLIFIER

## ECG AMPLIFIER

In medical applications, ECG amplifiers must extract millivolt low frequency $A C$ signals from the skin of the patient while rejecting AC common mode interference and static DC potentials created at the electrode-to-skin interface. In Figure 42, the ISL28278 (U1) forms one of the multiple high gain AC band-pass amplifiers using active feedback. Amplifier U1B and RC RF1, CF1 form a high gain LP filtered amplifier with the corner frequency given by Equation 3:

$$
\begin{equation*}
\mathrm{f}-\mathrm{HPF}{ }_{-3 \mathrm{~dB}}=\frac{1}{2 \times \mathrm{Pi} \times \mathrm{RF} 1 \times \mathrm{CF} 1} \tag{EQ.3}
\end{equation*}
$$

Inserting the low pass amplifier, U1B, in the U1A feedback loop results in an overall high-pass frequency response. Voltage divider pairs $R_{1}-R_{2}$ and $R_{3}-R_{4}$ set the overall amplifier pass-band gain. The $D C$ input offset is canceled by U1B at the U1A inverting input. Resistor divider pair $\mathrm{R}_{\mathbf{3}}-\mathrm{R}_{\mathbf{4}}$ defines the maximum input DC level that is canceled, and is given by Equation 4:

$$
\begin{equation*}
V_{I N} D C=V_{+} \times\left(\frac{R_{4}}{R_{3}+R_{4}}\right) \tag{EQ.4}
\end{equation*}
$$

In the passband range, U1B gain is +1 , and the total signal gain is defined by the divider ratios according to Equation 5 :

$$
\begin{equation*}
\mathrm{V}_{\mathrm{OUT}} \mathrm{U} 1 \mathrm{GAIN}=\frac{\mathrm{V}_{\mathrm{OUT}}}{\mathrm{~V}_{\mathrm{IN}}}=\left(\frac{\mathrm{R}_{1}+\mathrm{R}_{2}}{\mathrm{R}_{2}}\right) \times\left(\frac{\mathrm{R}_{3}+\mathrm{R}_{4}}{\mathrm{R}_{4}}\right) \tag{EQ.5}
\end{equation*}
$$

At frequencies greater than the LPF corner, the $R_{1}-C_{1}$ and $R_{3}-C_{3}$ networks work to roll-off the U1A gain to unity. Setting both R-C time constants to the same value simplifies to Equation 6:

$$
\begin{equation*}
f-L P F_{-3 d B}=\frac{1}{2 \times P i \times R_{1} \times C_{1}} \tag{EQ.6}
\end{equation*}
$$

Right leg drive and reference amplifiers U2A and U2B form a DC feedback loop that applies a correction voltage at the right leg
electrode to cancel out DC and low frequency body interference. The voltage at the $\mathrm{V}_{\mathrm{CM}}$ sense electrode is maintained at the reference voltage set by RF1-RF2.
With the values shown in Figure 42, the ECG circuit performance parameters are:

1. Supply Voltage Range $=+2.4 \mathrm{~V}$ to +5.5 V
2. Total Supply Current Draw $@+5 \mathrm{~V}=500 \mu \mathrm{~A}$ (typ)

FIGURE 42. ECG AMPLIFIER

## Revision History

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to web to make sure you have the latest revision.

| DATE | REVISION | CHANGE |
| :---: | :---: | :---: |
| June 16, 2011 | FN6145.4 | On page 1, Features: changed "300kHz typical gain-bandwidth product" to "250kHz typical gain-bandwidth product" Added Related Literature section with link to "AN1345: ISL2827xEVAL1Z Evaluation Board User Guide." <br> On page 1: added Figure 1, Typical Application Circuit diagram. <br> On page 4, Absolute Maximum Ratings: removed "Supply Turn On Voltage Slew Rate . . . 1V/ $\mu \mathrm{s}$ ". Under "Operating Conditions," added "Supply Voltage . . . 2.4V ( $\pm 1.2 \mathrm{~V}$ ) to $5.5 \mathrm{~V}( \pm 2.75 \mathrm{~V})$ " and changed "Operating Junction Temperature" to "Maximum Operating Junction Temperature". <br> On page 4, Electrical Specifications: <br> - Changed AVOL room temperature MIN from 200V/mV to 103dB; changed over-temp MIN from 190V/mV to 102 dB ; changed TYP from $300 \mathrm{~V} / \mathrm{mV}$ to 109 dB . For $R_{L}=1 \mathrm{k} \Omega$, changed TYP from $60 \mathrm{~V} / \mathrm{mV}$ to 95 dB . <br> - Split $\mathrm{V}_{\mathrm{OUT}}$ into two parameters: $\mathrm{V}_{\mathrm{OL}}$ and $\mathrm{V}_{\mathrm{OH}}$. For Output Voltage Swing, High, removed MIN limits, changed TYP from 4.996 V and 4.880 V to 4 mV and 120 mV ; added MAX limits. <br> - For Gain Band Width, changed TYP from 300 kHz to 250 kHz . <br> - For Slew Rate, removed MIN/MAX limits; changed TYP from $\pm 0.14 \mathrm{~V} / \mu \mathrm{s}$ to $\pm 0.15 \mathrm{~V} / \mu \mathrm{s}$. <br> On page 6: replaced FIGURE 6. PSRR vs FREQUENCY. <br> On page 7: Typical Performance Curves: Added Figure 8 "FREQUENCY RESPONSE vs CLOSED LOOP GAIN", Figure 9 "CROSSTALK vs FREQUENCY", Figure 10 "VOLTAGE NOISE vs FREQUENCY" and Figure 11 "CURRENT NOISE vs FREQUENCY" <br> On page 13: under "Proper Layout Maximizes Performance" removed discussion of guard ring for unity gain amplifier, and removed Figure 37. GUARD RING EXAMPLE FOR UNITY GAIN AMPLIFIER. |
|  | FN6145.3 | - Changed $\mathrm{I}_{\mathrm{O}^{+}}, \mathrm{I}_{\mathrm{O}^{-}}$specs. <br> - Updated Supply Voltage in Electrical Specifications table; added CDM ESD spec. <br> - Changed Noise Current TYP from 0.04pA to 9fA <br> - Updated noise plots (Fig.7, 8, 9) <br> - Updated transient response plots (Fig 10, 11) <br> - Added ECG circuit to Applications section |
|  | FN6145.2 | Added ISL28476 Quad to the ISL28276 Dual data sheet. |
|  | FN6145.1 | Pg 10: revised Pin Description to include ISL28478 pin numbers. |
| 9/18/2006 | FN6145.0 | Initial Release |

## Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to www.intersil.com/products for a complete list of Intersil product families.
For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: ISL28278, ISL28478
To report errors or suggestions for this datasheet, please go to: www.intersil.com/askourstaff
FITs are available from our website at: http://rel.intersil.com/reports/sear

Rev. F 2/07
NOTES:

1. Plastic or metal protrusions of 0.006 " maximum per side are not included.
2. Plastic interlead protrusions of 0.010 " maximum per side are not included.
3. Dimensions "D" and "E1" are measured at Datum Plane "H".
4. Dimensioning and tolerancing per ASME Y14.5M-1994.

For additional products, see www.intersil.com/product tree
Intersil products are manufactured, assembled and tested utilizing IS09000 quality systems as noted in the quality certifications found at www.intersil.com/design/quality
Intersil products are sold by description only. Intersil Corporation reserves the right to make changes in circuit design, software and/or specifications at any time without notice. Accordingly, the reader is cautioned to verify that data sheets are current before placing orders. Information furnished by Intersil is believed to be accurate and reliable. However, no responsibility is assumed by Intersil or its subsidiaries for its use; nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Intersil or its subsidiaries.
