

## ANY-FREQUENCY PRECISION CLOCK MULTIPLIER/JITTER ATTENUATOR

### Features

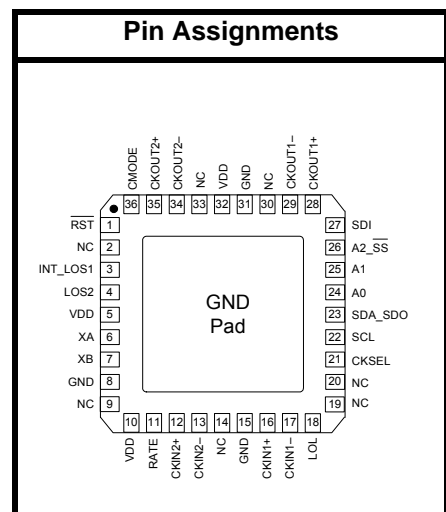

- Generates any frequency from 2 kHz to 808 MHz from an input frequency of 2 kHz to 710 MHz
- Ultra-low jitter clock outputs with jitter generation as low as 0.5 ps rms (12 kHz–20 MHz)
- Integrated loop filter with selectable loop bandwidth (4 to 525 Hz)
- Meets OC-192 GR-253-CORE jitter specifications
- Dual clock inputs with manually controlled hitless switching
- Free run and VCO freeze modes
- Support for ITU G.709 and custom FEC ratios (255/238, 255/237, 255/236)
- LOL and LOS alarm outputs
- I<sup>2</sup>C or SPI programmable
- Single 1.8, 2.5, 3.3 V supply
- Small size: 6 x 6 mm 36-lead QFN
- Pb-free, ROHS compliant

### Applications

- Dual clock outputs with programmable signal format (LVPECL, LVDS, CML, CMOS)
- SONET/SDH OC-48/OC-192/STM-16/STM-64 line cards
- ITU G.709 and custom FEC line cards
- GbE/10GbE, 1/2/4/8/10G Fibre Channel line cards
- Synchronous Ethernet
- Optical modules
- Wireless repeaters/wireless backhaul
- Data converter clocking
- xDSL
- PDH clock synthesis
- Test and measurement
- Broadcast video

### Description

The Si5327 is a jitter-attenuating precision clock multiplier for applications requiring sub 1 ps jitter performance. The Si5327 accepts two input clocks ranging from 2 kHz to 710 MHz and generates two output clocks ranging from 2 kHz to 808 MHz. The two outputs are divided down separately from a common source. The Si5327 can also use its crystal oscillator as a clock source for frequency synthesis. The device provides virtually any frequency translation combination across this operating range. The Si5327 input clock frequency and clock multiplication ratio are programmable through an I<sup>2</sup>C or SPI interface. The Si5327 is based on Silicon Laboratories' 3rd-generation DSPLL<sup>®</sup> technology, which provides frequency synthesis and jitter attenuation in a highly integrated PLL solution that eliminates the need for external VCXO and loop filter components. The DSPLL loop bandwidth is digitally programmable, providing jitter performance optimization at the application level. Operating from a single 1.8, 2.5, or 3.3 V supply, the Si5327 is ideal for providing clock multiplication and jitter attenuation in high performance timing applications.

## 4. Functional Description

Figure 7. Functional Block Diagram

The Si5327 is a jitter-attenuating precision clock multiplier for applications requiring sub 1 ps jitter performance. The Si5327 accepts two input clocks ranging from 2 kHz to 710 MHz and generates two output clocks ranging from 2 kHz to 808 MHz. The Si5327 can also use its crystal oscillator as a clock source for frequency synthesis. The device provides virtually any frequency translation combination across this operating range. Independent dividers are available for each input clock and output clock, so the Si5327 can accept input clocks at different frequencies and it can generate output clocks at different frequencies. The Si5327 input clock frequency and clock multiplication ratio are programmable through an I<sup>2</sup>C or SPI interface. Silicon Laboratories offers a PC-based software utility, DSPLLsim, that can be used to determine the optimum PLL divider settings for a given input frequency/clock multiplication ratio combination that minimizes phase noise and power consumption. This utility can be downloaded from <http://www.silabs.com/timing>.

The Si5327 is based on Silicon Laboratories' 3rd-generation DSPLL<sup>®</sup> technology, which provides any frequency synthesis and jitter attenuation in a highly integrated PLL solution that eliminates the need for external VCXO and loop filter components. The Si5327 PLL loop bandwidth is digitally programmable and supports a range from 4 to 525 Hz. The DSPLLsim software utility can be used to calculate valid loop bandwidth settings for a given input clock frequency/clock multiplication ratio.

The Si5327 supports hitless switching between the two manually controlled synchronous input clocks in compliance with GR-253-CORE that greatly minimizes the propagation of phase transients to the clock outputs during an input clock transition (maximum 200 ps phase change). The Si5327 monitors both input clocks for loss-of-signal (LOS) and provides a LOS alarm (INT\_LOS1 and LOS2) when it detects missing pulses on either input clock. The device monitors the lock status of the PLL. The lock detect algorithm works by continuously monitoring the phase of the input clock in relation to the phase of the feedback clock. The Si5327 provides a digital hold capability that allows the device to continue generation of a stable output clock when the selected input reference is lost. During digital hold, the DSPLL generates an output frequency based on a historical average frequency that existed for a fixed amount of time before the error event occurred, eliminating the effects of phase and frequency transients that may occur immediately preceding digital hold.

The Si5327 has two differential clock outputs. The electrical format of each clock output is independently programmable to support LVPECL, LVDS, CML, or CMOS loads. If not required, the second clock output can be powered down to minimize power consumption. The device input to output skew is not specified. For system-level debugging, a bypass mode is available which drives the output clock directly from the input clock, bypassing the internal DSPLL. The device is powered by a single 1.8, 2.5, or 3.3 V supply.

## 4.1. External Reference

An external, high quality clock or a low-cost 40 MHz crystal is used as part of a fixed-frequency oscillator within the DSPLL. This external reference is required for the device to perform jitter attenuation. Silicon Laboratories recommends using a high quality crystal. Specific recommendations may be found in the Family Reference Manual.

In digital hold, the DSPLL remains locked and tracks the external reference. Note that crystals can have temperature sensitivities.

If there is a need to use a reference oscillator instead of a crystal, Silicon Labs does not recommend using MEMS based oscillators. The very low loop BW of the Si5327 means that it can be susceptible to XAXB reference sources that have high wander. Experience has shown that in spite of having low jitter, some MEMS oscillators have high wander, and these devices should be avoided. Contact Silicon Labs for details.

## 4.2. Further Documentation

Consult the Silicon Laboratories Si53xx Any Frequency Precision Clock Family Reference Manual (Si53xx FRM) for detailed information about the Si5327 functions. Additional design support is available from Silicon Laboratories through your distributor.

Silicon Laboratories has developed a PC-based software utility called DSPLLsim to simplify device configuration, including frequency planning and loop bandwidth selection. The FRM and this utility can be downloaded from <http://www.silabs.com/timing>.

## 6. Register Descriptions

### Register 0.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name		FREE_RUN	CKOUT_ALWAYS_ON				BYPASS_REG	
Type	R	R/W	R/W	R	R	R	R/W	R

Reset value = 0001 0100

Bit	Name	Function
7	Reserved	
6	FREE_RUN	<b>Free Run.</b> Internal to the device, route XA/XB to CKIN2. This allows the device to lock to its XA-XB reference. 0: Disable 1: Enable
5	CKOUT_ALWAYS_ON	<b>CKOUT Always On.</b> This will bypass the SQ_ICAL function. Output will be available even if SQ_ICAL is on and ICAL is not complete or successful. See Table 8 on page 20. 0: Squelch output until part is calibrated (ICAL). 1: Provide an output. Note: The frequency may be significantly off and variable until the part is calibrated.
4:2	Reserved	
1	BYPASS_REG	<b>Bypass Register.</b> This bit enables or disables the PLL bypass mode. Use only when the device is in digital hold or before the first ICAL. 0: Normal operation 1: Bypass mode. Selected input clock is connected to CKOUT buffers, bypassing the PLL. Bypass mode does not support CMOS clock outputs.
0	Reserved	

## Register 2.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name	BWSEL_REG [3:0]							
Type	R/W				R	R	R	R

Reset value = 0100 0010

Bit	Name	Function
7:4	BWSEL_REG [3:0]	<b>BWSEL_REG.</b> Selects nominal f3dB bandwidth for PLL. See DSPLL <i>sim</i> for settings. After BWSEL_REG is written with a new value, an ICAL is required for the change to take effect.
3:0	Reserved	

## Register 3.

Bit	D7	D6	D5	D4	D3	D2	D1	D0
Name			VCO_FREEZE	SQ_ICAL				
Type	R		R/W	R/W	R	R	R	R

Reset value = 0000 0101

Bit	Name	Function
7:6	Reserved	
5	VCO_FREEZE	<b>VCO_FREEZE.</b> Forces the part into VCO freeze. This bit overrides all other manual and automatic clock selection controls. 0: Normal operation. 1: Force VCO freeze mode. Overrides all other settings and ignores the quality of all of the input clocks.
4	SQ_ICAL	<b>SQ_ICAL.</b> This bit determines if the output clocks will remain enabled or be squelched (disabled) during an internal calibration. See Table 8 on page 20. 0: Output clocks enabled during ICAL. 1: Output clocks disabled during ICAL.
3:0	Reserved	

**Register 4.**

## 7. Pin Descriptions: Si5327

Pin #	Pin Name	I/O	Signal Level	Description
1	$\overline{\text{RST}}$	I	LVC MOS	<b>External Reset.</b> Active low input that performs external hardware reset of device. Resets all internal logic to a known state and forces the device registers to their default value. Clock outputs are tristated during reset. The part must be programmed after a reset or power on to get a clock output. See the Si53xx Family Reference Manual for details. This pin has a weak pull-up.
2, 9, 14, 19, 20, 30, 33	NC			<b>No Connection.</b> Leave floating. Make no external connections to this pin for normal operation.
3	INT_LOS1	O	LVC MOS	<b>Interrupt/CKIN1 LOS Indicator.</b> This pin functions as a device interrupt output or an alarm output for CKIN1. If used as an interrupt output, <i>INT_PIN</i> must be set to 1. The pin functions as a maskable interrupt output with active polarity controlled by the <i>INT_POL</i> register bit. If used as an alarm output, the pin functions as a LOS alarm indicator for CKIN1. Set <i>CK1_BAD_PIN</i> = 1 and <i>INT_PIN</i> = 0. 0 = CKIN1 present 1 = LOS on CKIN1 The active polarity is controlled by <i>CK_BAD_POL</i> . If no function is selected, the pin tristates.
<b>Note:</b> Internal register names are indicated by underlined italics, e.g., <i>INT_PIN</i> . See Section "5. Register Map".

Output is differential for LVPECL, LVDS, and CML compatible modes. For CMOS format, both output pins drive identical single-ended clock outputs.
36	CMODE	I	LVC MOS	<b>Control Mode.</b> Selects I <sup>2</sup> C or SPI control mode for the Si5327. 0 = I <sup>2</sup> C Control Mode 1 = SPI Control Mode This pin must not be NC. Tie either high or low. See the Si53xx Family Reference Manual for details on I <sup>2</sup> C or SPI operation.
GND PAD	GND	GND	Supply	<b>Ground Pad.</b> The ground pad must provide a low thermal and electrical impedance to a ground plane.
<b>Note:</b> Internal register names are indicated by underlined italics, e.g., <i>INT_PIN</i> . See Section “5.Register Map”.				

Table 9 lists all of the register locations that should be followed by an ICAL after their contents are changed.

**Notes:**

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing per ANSI Y14.5M-1994.
3. This drawing conforms to JEDEC outline MO-220, variation VJJD.
4. Recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

**Notes:**

**General**

- All dimensions shown are in millimeters (mm) unless otherwise noted.
- Dimensioning and Tolerancing is per the ANSI Y14.5M-1994 specification.
- This Land Pattern Design is based on IPC-SM-782 guidelines.
- All dimensions shown are at Maximum Material Condition (MMC). Least Material Condition (LMC) is calculated based on a Fabrication Allowance of 0.05 mm.

**Solder Mask Design**

- All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60  $\mu$ m minimum, all the way around the pad.

**Stencil Design**

- A stainless steel, laser-cut, and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
- The stencil thickness should be 0.125 mm (5 mils).
- The ratio of stencil aperture to land pad size should be 1:1 for the perimeter pads.
- A 4 x 4 array of 0.80 mm square openings on 1.05 mm pitch should be used for the center ground pad.

**Card Assembly**

- A No-Clean, Type-3 solder paste is recommended.
- The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

## DOCUMENT CHANGE LIST

### Revision 0.1 to Revision 0.4

- Updated Table 3, “AC Specifications,” on page 9.
  - Added table note.
- Updated Table 5, “Jitter Generation,” on page 14.
  - Updated maximum jitter generation specifications.

### Revision 0.4 to Revision 1.0

- Minor changes to Table 2 on page 5
- Minor changes to Table 4 on page 12
- Added maximum lock and settle time specs to Table 3.
- Fixed typos in description of Register 10 on page 28.
- Fixed typos in description of Register 48 on page 41.
- Added warning about MEMS oscillators to "4.1." on page 20.
