AC4490

Hardware Integration Guide
Version 4.5

REVISION HISTORY

Version	Date	Description	Approved By
4.2	16 Dec 2013	Separated into two separate docs (Hardware Integration Guide and User Guide). Information in this document was originally part of the User Guide. Added a Related Documents section. **Note:** Starting at Rev 4.2 to match the current User Guide.	Sue White
4.3	09 Apr 2014	Updated Serial Interface information to: Serial Interface and Digital I/O — 3.3V TTL only, all part numbers — UART baud rates from 1200 bps to 115,200 bps	Chris Downey
4.4	28 Apr 2014	Updated Serial Interface information to: Serial Interface and I/O — 3.3V TTL — UART baud rates from 1200 bps to 115,200 bps	Chris Downey
4.5	4 Aug 2014	Added Approved Antenna List	Chris Downey

FCC Notice

> **WARNING:** This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference and (2) This device must accept any interference received, including interference that may cause undesired operation.

RF Exposure/Installation Instructions

> **WARNING:** To satisfy FCC RF exposure requirements for mobile transmitting devices, this equipment must be professionally installed such that the end user is prevented from replacing the antenna with a non-approved antenna. The end user should also be prevented from being within 20cm of the antenna during normal use with the exception of hands, feet, wrists and ankles.
>
> The preceding statement must be included as a CAUTION statement in manuals for OEM products to alert users on FCC RF Exposure compliance.

Caution: Any change or modification not expressly approved by Laird could void the user's authority to operate the equipment.

AC4490 RF TRANSCEIVER

The compact AC4490 900 MHz transceiver can replace miles of cable in harsh industrial environments. Using field-proven frequency hopping spread spectrum (FHSS) technology which needs no additional FCC licensing in the Americas, OEMs can easily make existing systems wireless with little or no RF expertise.

Overview

The AC4490 is a cost effective, high performance, frequency hopping spread spectrum transceiver designed for integration into OEM systems operating under FCC part 15.247 regulations for the 900 MHz ISM band.

AC4490 transceivers provide an asynchronous TTL/RS-485 level serial interface for OEM Host communications, which include both system and configuration data. The Host supplies system data for transmission to other Host(s). Configuration data is stored in the on-board EEPROM. All frequency hopping, synchronization, and RF system data transmission/reception is performed by the transceiver.

To boost data integrity and security, the AC4490 uses Laird's field-proven FHSS technology featuring optional Data-Encryption Standards (DES). Fully transparent, these transceivers operate seamlessly in serial cable replacement applications.

AC4490 transceivers can operate in Point-to-Point, Point-to-Multipoint, Client-Server, or Peer-to-Peer architecture. One transceiver is configured as a server with one or many client-configured transceivers synchronized to it. To establish synchronization between transceivers, the server emits a beacon; upon detecting a beacon an RF link is established and a GPIO is toggled to signify to the host that the link is active.

This document contains information about the hardware and software interface between a Laird AC4490 transceiver and an OEM Host. Information includes the theory of operation, specifications, interface definition, configuration information and mechanical drawings. The OEM is responsible for ensuring the final product meets all appropriate regulatory agency requirements listed herein before selling any product.

Note: Unless mentioned by name, the AC4490 module is referred to as the "radio" or "transceiver". Individual naming is used to differentiate product specific features. The host (PC / Microcontroller / Any device to which the AC4490 module is connected) will be referred to as "OEM Host".

FEATURES

Networking and Security

- Generic I/O digital lines and integrated DAC/ADC functions
- Retries and Acknowledgements
- API Commands to control packet routing and acknowledgement on a packet-by-packet basis
- Frequency Hopping Spread Spectrum for security and interference rejection
- Customizable RF Channel number and system ID
- Dynamic link analysis, remote radio discovery
- Low latency and high throughput
- Hardware Protocol Status monitoring

Easy to Use

- Continuous 76.8 Kbps RF data stream
- Software selectable interface baud rates from 1200 bps to 115.2 Kbps
- Low cost, low power and small size ideal for high volume, portable and battery powered applications
- All modules are qualified for Industrial temperatures (-40° C to 85° C)
- Advanced configuration available using AT commands

DETAILED SPECIFICATIONS

Table 1: AC4490 Specification table

GENERAL							
20 Pin Interface Connector	Molex 87759-0030, mates with Samtec SMM-110-02-S-D						
RF Connector	MMCX jack Johnson Components 135-3711-822						
Antenna	AC4490-1x1: Customer must provide AC4490-200: External antenna with MMCX plug or integral antenna AC4490-1000: External antenna with MMCX plug						
Serial Interface and I/O	3.3V TTL UART baud rates from 1200 bps to 115,200 bps						
Power Consumption (typical)	Duty Cycle (Tx = Transmit, Rx = Receive)						
		10%Tx	50%Tx	100%	100%Rx	Pwr-down	Deep Sleep
	1x1	33 mA	54 mA	80 mA	28 mA	15 mA	3 mA
	200	38 mA	68 mA	106 mA	30 mA	19 mA	6 mA
	1000	130 mA	650 mA	1300 mA	30 mA	19 mA	6 mA
Channels	3 Channel Sets comprising 56 total channels. AC4490-1x1: 3 Channel Sets AC4490-200: 3 Channel Sets AC4490-1000: 2 Channel Sets						
Security	One byte System ID. 56-bit DES encryption key						
Interface Buffer Size	Input/Output: 256 bytes each

TRANCEIVER		
Frequency Band	902 – 928 MHz	
RF Data Rate	76.8 Kbps fixed	
RF Technology	Frequency Hopping Spread Spectrum (FHSS)	
Output Power	**Conducted (no antenna)**	**EIRP (3 dBi gain antenna)**
	1x1 10 mW typical	20 mW typical
	200 100 mW typical	200 mW typical
	1000 743 mW typical	1486 mW typical
Supply Voltage	1x1 VCC: 3.3 V, ±50 mV ripple VPA: 3.3 V, ±50 mV ripple	
	200 VCC: 3.3 – 5.5 V, ±50 mV ripple VPA: 3.3 – 5.5 V, ±50 mV ripple	
	1000* VCC: 3.3 – 5.5 V ±50 mV ripple VPA: 3.3 ±3%, ±100 mV ripple	
	* VCC & VPA may be tied together, provided the supply voltage never falls below 3.3 V and is capable of supplying 1.5 A of current. VCC & VPA are internally connected on the AC4490-200 only.	
Sensitivity	**RF Data Rate** **Typical**	
	76.8 Kbps -100 dBm	
	76.8 Kbps (AC4490LR-200/-1000) -110 dBm	
	Note: Receive sensitivity listed for US and Australian modes. Radios ordered per Brazilian regulations have a receive sensitivity of -80 dBm.	
EEPROM write cycles	20000	
Hop period	20 ms	
Range, Outdoor Line of Site (based on 3dBi gain antenna)	1x1 Up to 1 mile	
	200 Up to 4 miles	
	LR200 Up to 8 miles	
	1000 Up to 20 miles	
	LR1000 Up to 40 miles	
	Note: Distance based on US and Australian Modes	
ENVIRONMENTAL		
Temperature (Operational)	-40° C to +80° C (-40° F to +176° F)	
Temperature (Storage)	-50° C to +85° C (-58°F to +185° F)	
Humidity (non-condensing)	10% - 90%	
PHYSICAL		
Dimensions	Transceiver w/ MMCX connector:	1.65" x 1.9" x 0.20"
	Transceiver w/ integral antenna:	1.65" x 2.65" x 0.20"
	AC4490-1x1:	1.00" x 1.00" x 0.162"

HARDWARE

Pin Definitions

The AC4490 has a simple interface that allows OEM host communications with the transceiver and shows the connector pin numbers and associated functions.

Table 4: AC4490 Pin Definitions

Module Pin	1x1 Pin	Type	Signal Name	Function
1	4	O	GO0	Generic Output pin
2	6	O	TXD	Serial data output from the module to the OEM Host.
2[1]		I/O	RS485 A (True)[1]	Non-inverted RS485 representation of serial data
3	7	I	RXD	Serial data input to the module from the OEM Host.
3[1]		I/O	RS485 B (Invert)[1]	Mirror image of RS485 A
4	5[2]		GI0	Generic Input pin
5	3	GND	GND	Signal Ground
6		O	Hop Frame	Pulses low when the transceiver is hopping frequencies.
7	9	O	CTS	Clear to Send – Active Low when the transceiver is ready to accept data for transmission. CTS should be monitored by the OEM Host & data flow to the radio should cease when CTS is High.
8	10[2]	I	RTS	Request to Send – When enabled in EEPROM, the OEM Host can take this High when it is not ready to accept data from the transceiver. **Note:** Keeping RTS High for too long can cause data loss.
9	19	O	GO1	Generic Output pin
10	2	PWR	VCC	Powers the radio and microcontroller. Must be connected. **1x1**: 3.3 V, +/- 50 mV ripple **200**: 3.3 – 5.5 V, +/- 50 mV ripple (Pin 10 is internally connected to Pin 11) **1000**: 3.3 – 5.5V, +/-50mV ripple
11	11	PWR	VPA	Powers the power-amplifier and draws most current when in TX mode. Must be connected. **1x1**: 3.3 V, +/- 50 mV ripple **200**: 3.3 – 5.5 V, +/- 50 mV ripple (Pin 11 is internally connected to Pin 10) **1000**: 3.3 V +/- 3%, +/- 100 mV ripple
12	23	I	Test	Test Mode – When pulled logic Low and then applying power or resetting, the transceiver's serial interface is forced to a 9600, 8-N-1 rate. To exit, the transceiver must be reset or power-cycled with Test Mode logic High.
13	12	O	RSSI	Received Signal Strength - An analog output giving an instantaneous indication of received signal strength. Only valid

Americas: +1-800-492-2320
Europe: +44-1628-858-940
Hong Kong: +852 2923 0600

Module Pin	1x1 Pin	Type	Signal Name	Function
				while in Receive Mode.
14	21[2]	I	GI1	Generic Input pin
15	16	I	UP_RESET	RESET – Controlled by the AC4490 for power-on reset if left unconnected. After a stable power-on reset, a logic High pulse will reset the transceiver.
16	13	GND	GND	Signal Ground
17	17	I	$\overline{CMD}$ /Data	When logic Low, the transceiver interprets OEM Host data as command data. When logic High, the transceiver interprets OEM Host data as transmit data.
18	15[3]	I	AD In	10-bit Analog Data Input
19	20[4]	O	DA_Out	10-bit Analog Data Output
20	18	O	$\overline{In\_Range}$	When logic Low, a client is in range of a server on same Channel and System ID. Always low on a server radio.
N/A	14	RF	RF Port	RF Interface
N/A	22	I	$\overline{Reset}$	Active Low version of UP_RESET. If RESET is used, UP_RESET should be left floating and if UP_RESET is used, RESET should be left floating.

1. When ordered with a RS485 interface (not available on the AC4490-1x1).
2. Must be tied to VCC or GND if not used. Should never be permitted to float.
3. If used, requires a shunt 0.1 µF capacitor at pin 15 followed by a series 1 k resistor.
4. If used, requires a series 1 k resistor at pin 20 followed by a shunt 0.1 µF capacitor.

Notes: All I/O is 3.3 V TTL with exception of 5 V inputs on AC4490-200.
All inputs are weakly pulled High (10 k) and may be left floating during normal operation.
Minimum connections: VCC, VPA, GND, TXD, & RXD.
Signal direction depends on the transceiver.
Leave unused pins disconnected.

Pin Descriptions

Generic I/O

Both GI0/1 pins serve as generic input pins and both GO0/1 pins server as generic output pins. Reading and writing of these pins can be performed using CC Commands. These pins alternatively serve as control pins when modem mode is enabled.

TXD & RXD

Serial TTL	The AC4490-200 accepts 3.3 or 5 V DC TTL level asynchronous serial data on the RXD pin and interprets that data as either command data or transmit data. Data is sent from the transceiver, at 3.3V levels, to the OEM host via the TXD pin. **Note:** The AC4490-1000 and AC4490-1x1 transceivers **only** accept 3.3 V level signals.
RS-485	When equipped with an on-board RS-485 interface chip, TXD and RXD become the half duplex RS-485 pins. The transceiver interface is in Receive Mode except when it has data to send to the OEM host. TXD is the non-inverted representation of the data (RS485A) and RXD is a mirror image of TXD (RS485B). The transceiver still uses RTS (if enabled).

$\overline{\text{CTS}}$

The AC4490 has an interface buffer size of 256 bytes. If the buffer fills up and more bytes are sent to the transceiver before the buffer can be emptied, data loss occurs. The transceiver prevents this loss by asserting CTS High as the buffer fills up and asserting CTS Low as the buffer is emptied. CTS On and CTS On Hysteresis control the operation of CTS. CTS On specifies the amount of bytes that must be in the buffer for CTS to be disabled (logic High). Even while CTS is disabled, the OEM host can send data to the transceiver, but it should do so carefully.

Note: The CTS On and CTS On Hysteresis bytes of the EEPROM can be set to 1, in which case CTS goes high as data is sent in and low when the buffer is empty.

GND

Signal Ground. Pins are internally connected.

RTS

With RTS disabled, the transceiver sends any received data to the OEM host when it is received. However, some OEM hosts are not able to accept data from the transceiver all of the time. With RTS enabled, the OEM host can prevent the transceiver from sending data by setting RTS logic High. Once RTS is set logic Low, the transceiver can send packets to the OEM host as they are received.

Note: Leaving RTS logic high for too long can cause data loss once the 256 byte receive buffer fills up.

$\overline{\text{Test}}$

When pulled logic Low before applying power or resetting, the transceiver's serial interface is forced to 9600 baud, 8-N-1 (8 data bits, No parity, 1 stop bit). To exit, the transceiver must be reset or power-cycled with Test

Embedded Wireless Solutions Support Center:
http://ews-support.lairdtech.com
www.lairdtech.com/ramp

12

Americas: +1-800-492-2320
Europe: +44-1628-858-940
Hong Kong: +852 2923 0600

pin logic High. This pin is used to recover transceivers from unknown baud rates only. It should not be used in normal operation. Instead, the transceiver Interface Baud Rate should be programmed to 9600 baud if that rate is desired for normal operation.

Note: Laird does not recommend permanently grounding the Forced_9600 pin. This mode was intended for recovering transceivers from unknown settings and was not intended to be used in real-time communications. The following modes are affected:

Modem mode = disabled
Parity mode = disabled
Interface Timeout = 0x40

It is also possible that future modes will be disabled by grounding Forced_9600.

RSSI

Instantaneous RSSI

Received Signal Strength Indicator can be used by the OEM Host as an indication of instantaneous signal strength at the receiver. The OEM Host must calibrate RSSI without an RF signal present at the receiver.

Calibration is accomplished by following these steps:
1. Power up only one transceiver in the coverage area.
2. Measure the RSSI to obtain the minimum value with no other signal present.
3. Power up another transceiver and begin sending data from that transceiver to the transceiver being measured. Make sure the two transceivers are separated by approximately ten feet.
4. Measure the peak RSSI, while the transceiver is actively receiving data from the remote transceiver, to obtain a maximum value at full signal strength.

The following equation approximates the RSSI curve:

$$Signal\ Strength\ (dBm) = (-46.9 \times VRSSI) - 53.9$$

Figure 2: RSSI Voltage vs. Received Signal Strength

Validated RSSI

Because RSSI is only valid when the local transceiver is receiving an RF packet from a remote transceiver, instantaneous RSSI is tricky to use. Therefore, the transceiver stores the most recent valid RSSI value. The OEM host issues the Report Last Good RSSI command to request that value. Additionally, validated RSSI can be obtained from Receive Packet and Send Data Complete API commands and from the Probe command. Validated RSSI is not available at the RSSI pin.

Hong Kong: +852 2923 0600

UP_Reset

UP_Reset provides a direct connection to the reset pin on the AC4490 microprocessor and is used to force a soft reset.

$\overline{CMD}$ /Data

When $\overline{CMD}$ Data is held High the transceiver interprets incoming OEM Host data as transmit data to be sent to other transceivers. When $\overline{CMD}$ Data is held Low the transceiver interprets OEM Host data as command data.

AD In

AD In can be used as a cost savings to replace Analog-to-Digital converter hardware. Reading of this pin can be performed locally using the Read ADC command. See the AC4490 User Guide for command descriptions.

$\overline{In\ Range}$

Asserts logic Low when a client transceiver is in range of a server radio operating on the same RF Channel and System ID. If a client cannot hear a server for the amount of time defined by Range Refresh, it will drive In_Range High and enter search mode looking for a server. When a server is detected, In_Range will be asserted Low. In_Range will always report Low on server transceivers.

SERIAL INTERFACE

For the OEM host and a transceiver to communicate via serial interface they must share a serial data rate. Refer to the following sections to ensure that the OEM host data rate matches the serial interface baud rate.

Serial Communications

The AC4490 is a TTL device which may connect to a compatible UART (Universal Asynchronous Receiver Transmitter) or level translator to connect to serial devices. The UART mainly transmits or receives serial data.

Asynchronous Operation

Since there is no separate clock in asynchronous operation, the receiver must use a fixed baud rate and START and STOP bits to synchronize with the transmitter. Figure 3 shows a typical asynchronous mode signal.

Figure 3: Asynchronous Mode Signal

The UART outputs and inputs logic level signals on the TX and RX pins. The signal is high when no data is being transmitted and low when transmission begins. The signal stays low for the duration of the START bit and is followed by the data bits (LSB first). The STOP bit follows the last data bit and is always high. When the STOP bit finishes, the START bit of the next transmission can occur.

Parity

A parity bit is used to provide error checking for a single bit error. When a single bit is used, parity can be either even or odd. Even parity means that the number of ones in the data plus the parity equals an even number and vice-versa. The ninth data bit can be used as a parity bit if the data format requires eight data bits and a parity bit as shown in Figure 4.
Figure 4: Even Parity Bit

> **Note:** Enabling parity cuts throughput and the interference buffer in half.

Table 5 displays supported asynchronous serial data formats:

Table 5: Supported Serial Formats

Data Bits	Parity	Stop Bits	Transceiver Programming Requirements
8	N	1	Parity Disabled
7	N	2	Parity Disabled
7	E, O, M, S	1	Parity Disabled
9	N	1	Parity Enabled
8	N	2	Parity Enabled

Data Bits	Parity	Stop Bits	Transceiver Programming Requirements
8	E, O, M, S	1	Parity Enabled
7	E, O, M, S	2	Parity Enabled
Mark (M) corresponds to 1 & Space (S) corresponds to 0			

Serial Interface Baud Rate

This two-byte value determines the baud rate used for communicating over the serial interface between the OEM Host and the transceiver. This rate is independent of the RF baud rate, which is fixed at 76.8 Kbps. Table 6 lists values for some common baud rates.

Note: Baud rates below 1200 baud are not supported.

For a baud rate to be valid, the calculated baud rate must be within ±3% of the OEM host baud rate. If the Test pin (pin 12) is pulled Logic Low at reset, the baud rate will be forced to 9600. For baud rate values other than those shown in Table 6, the following equations can be used:

$$\mathrm{BAUD} = \frac{14.7456 \times 10^6}{64 \times Desired\ Baud}$$

$$BaudH = Always\ 0$$

$$BaudL = Low\ 8\ bits\ of\ BAUD\ (base\ 16)$$

Table 6: Baud Rate / Interface Timeout

Baud Rate	BaudL (0x42)	BaudH (0x43)	Minimum Interface Timeout (0x58)	Stop Bit Delay (0x3F)
115200	0xFE	0x00	0x02	0xFF
57600[1]	0xFC	0x00	0x02	0x03
38400	0xFA	0x00	0x02	0x08
28800	0xF8	0x00	0x02	0x0E
19200	0xF4	0x00	0x03	0x19
14400	0xF0	0x00	0x04	0x23
9600	0xE8	0x00	0x05	0x39
4800	0xD0	0x00	0x09	0x7A
2400	0xA0	0x00	0x11	0xFC
1200	0x40	0x00	0x21	0x00[2]

1. 57600 is the default baud rate

2. 0x00 yields a stop bit of 421 µSec. The stop bit at 1200 baud should be 833 µSec.

OEM Host Data Rate

The OEM host data rate is the rate with which the OEM host and transceiver communicate over the serial interface. This rate is independent of the RF baud rate, which is fixed at 76.8 Kbps. Possible values range from 1200 bps to 115200 bps.

RADIO INTERFACE

Protocol Status / Receive Acknowledgement

Note: Implemented in firmware v6.3 and later.

When enabled in EEPROM, GO0 and GO1 perform the functions of Protocol Status and Receive Acknowledgement.

Protocol Status

Every time the radio hops to hop bin 0, the radio asserts GO0 Low for the entire hop bin. GO0 goes low at the falling edge of the hop frame at the start of bin 0 and goes high with the rising edge of hop frame at the end of bin 0. During all other hops, GO0 is high.

Note: This mode is incompatible with Modem mode.

Receive Acknowledgement

The radio uses GO1 to signal that a valid RF acknowledgement has been received from the remote radio. GO1 is normally low and goes high within approximately 75 µSec of receiving a valid RF acknowledgement. It remains high until the end (rising edge) of the next hop.

Note: This mode is incompatible with Modem mode.

Flow Control

CTS On/CTS On Hysteresis (Flow Control)

Flow control refers to the control of data flow between transceivers. It is the method used to handle data in the transmit/receive buffer and determines how data flow between the transceivers is started and stopped. Often, one transceiver is capable of sending data at a higher rate than the other can receive it. Flow control allows the slower device to tell the faster device when to pause and resume data transmission.

When a transceiver has data to send, it sends a Ready To Send signal and waits for a Clear To Send response from the receiving unit. If the receiving radio is ready to accept data it will assert its CTS low. CTS will be reasserted when the buffer contains the number of bytes specified by CTS_OFF (EEPROM address 0x5D). These signals are sent apart from the data itself on separate wires.

Flow control refers to the control of data flow between transceivers. It is the method used to handle data in the transmit/receive buffer and determines how data flow between the transceivers is started and stopped. Often, one transceiver is capable of sending data faster than the other can receive it. Flow control allows the slower device to tell the faster device when to pause and resume data transmission.

If RTS Enable is enabled, the receiver will monitor RTS. If the OEM asserts its CTS (transceivers RTS) high, the transceiver will wait to send data over the serial bus to the OEM host until the RTS is asserted low. CTS should be monitored by the OEM host since this is the manner the transceiver signals the OEM Host that it's transmit buffer may be full. If it asserts CTS high, the OEM host should stop sending data over the serial bus. If CTS is asserted low, the OEM host can send data over the serial bus because the transmit buffer is not at its limit.

Tip

Can I implement a design using just TXD, RXD, and GND (three-wire Interface)?

Yes. However, it is strongly recommended that your hardware monitor the CTS pin of the radio. CTS is taken High by the radio when its interface buffer is getting full. Your hardware should stop sending at this point to avoid a buffer overrun (and subsequent loss of data).

You can perform a successful design without monitoring CTS. However, you need to take into account the amount of latency the radio adds to the system, any additional latency caused by Transmit Retries or Broadcast Attempts, how often you send data, non-delivery network timeouts and interface data rate. Polled type networks, where the server host requests data from the client host and the client host responds, are good candidates for avoiding the use of CTS. This is because no single transceiver can monopolize the RF link. Asynchronous type networks, where any radio can send to another radio at any point in time, are much more difficult to implement without the use of CTS.

SECURITY

The AC4490 product family utilizes a Frequency Hopping Spread Spectrum (FHSS) technology which provides the foundation for secure digital wireless communications. This section describes how spread spectrum technology works and explains how an OEM can enable specific security features available in the AC4490.

Spread Spectrum History

Spread Spectrum dates back to World War II when a German scientist was granted a patent on a simple frequency hopping continuous wave (CW) system. The allies also experimented with Spread Spectrum in World War II. These early research and development efforts tried to provide countermeasures for radar, navigation beacons, and communications. The U. S. military has used SS signals over satellites for at least 25 years.

How Spread Spectrum Works

SS radio communications has long been a favorite technology of the military because it resists jamming and is difficult to intercept. This very same technology is now being widely used in the commercial, industrial, and consumer markets.

The reason for this is because SS signals are distributed over a wide range of frequencies and then collected onto their original frequency at the receiver, making them so inconspicuous as to be transparent. Just as they are unlikely to be intercepted by a military opponent, they are also unlikely to interfere with other signals intended for business and consumer users – even signals transmitted on the same frequencies.

Spread signals are intentionally made to be a much wider band than the information they are carrying and they use special pseudo-noise codes to make them more noise-like. It is this characteristic that makes SS signals difficult to detect, intercept, and demodulate. SS signals are hard to detect on narrowband equipment because the signal's energy is spread over a much wider bandwidth. Further, SS signals are harder to jam (interfere with) than narrowband signals and have a much lower probability to be intercepted, which is why the military has used Spread Spectrum for so many years.

The spread of energy over a wide band makes SS signals less likely to interfere with narrowband communications. Narrowband communications, conversely, cause little to no interference to SS systems because the receiver effectively integrates the signal over a wide bandwidth to recover it.

Besides being hard to intercept and jam, spread spectrum signals are hard to exploit or imitate. Signal exploitation is the ability of a non-network member to listen to and use information from the network without being a valid network member or participant. Imitation is the act of falsely or maliciously introducing false traffic or messages into a network.

SS signals are also more secure than narrowband radio communications. Thus SS signals can have any degree of desired message privacy. Messages can also be encrypted to any level of desired secrecy. The very nature of SS allows military or intelligence levels of privacy and security with minimal complexity. While these characteristics may not be important to everyday business or consumer needs, they are important to understand.

Frequency Hopping Spread Spectrum

A FHSS radio does what its name implies: it "hops" from frequency to frequency over a wide band. The specific order in which frequencies are occupied is a function of a code sequence, and the rate of hopping from one frequency to another is a function of the information rate.

AC4490 Security Features

As mentioned at the beginning of this section, the AC4490 uses FHSS technology. In addition, Laird has implemented three levels of security in the AC4490. All three levels of security are associated with their own EEPROM parameter that can programmed for permanent operation or be changed during system operation in volatile memory. The first two levels of security must be configured to establish a network of transceivers and are defined as the Channel Number and System ID.

The Channel Number represents a specific hopping sequence and provides physical separation between collocated networks. Thus, all transceivers in a network must be programmed to the same channel number. There are a total of 48 channel numbers.

System ID is similar to a password character or network number and makes network eavesdropping more difficult. A receiving radio does not go in range of or communicate with another radio on a different system ID. There are a total of 256 system ID values.

If FHSS technology, channel number, and system ID are not enough to secure your data, the AC4490 supports the Data Encryption Standard (DES), which is the third level of security. Encryption is the process of encoding an information bit stream to secure the data content. The algorithm described in this standard specifies both encrypting and decrypting operations which are based on a binary number called a key.

A key of 56 bits is used to encrypt and decrypt the data. The encryption algorithm specified in this standard is commonly known among those using the standard. The unique key chosen for use in a particular application makes the results of encrypting data using the algorithm unique. Selection of a different key causes the encrypted data that is produced for any given set of inputs to be different. The cryptographic security of the data depends on the security provided for the key used to encrypt and decrypt the data.

Data can be recovered from the encrypted data only by using exactly the same key used to encrypt it. Unauthorized recipients of the encrypted data who know the algorithm but do not have the correct key cannot derive the original data algorithmically. However, anyone who does have the key and the algorithm can easily decrypt the encrypted data and obtain the original data. A standard algorithm based on a secure key thus provides a basis for exchanging encrypted data by issuing the key used to encrypt it to those authorized to have the data.

## ORDERING INFORMATION

Product Part Number Tree

Figure 13: Product Part Number Tree

Developer Kit Part Numbers

All of the above part numbers can be ordered as a development kit by prefacing the part number with "SDK-". As an example, part number AC4490-200A can be ordered as a development kit using the part number: SDK-AC4490-200A.

All developer's kits include (2) transceivers, (2) development boards, (2) 7.5 VDC unregulated power supplies, (2) serial cables, (2) USB cables, (2) antennas, configuration/testing software and integration engineering support.

COMPLIANCE INFORMATION

AC4490- 1x1

Due to the RF antenna trace residing on the OEM Host PCB, the FCC will not grant modular approval for the AC4490-1x1 and requires the OEM to submit their completed design for approval. Contact Laird for the approval procedure.

Agency Identification Numbers

Agency compliancy is a very important requirement for any product development. Laird has obtained modular approval for its products so the OEM only has to meet a few requirements to be eligible to use that approval. The corresponding agency identification numbers and approved antennas are listed below.

AC4490-1000	KQL-AC4490	2268C-AC44901000

Approved Antenna List

The following antennas are approved for use with the AC4490 as identified. The OEM may choose another vendor's antenna of like type and equal or lesser gain as a listed antenna and still maintain compliance.

Table 8: AC4490 Approved Antennas

1. Strictly requires professional installation.

FCC / IC Requirements for Modular Approval

In general, there are two agency classifications of wireless applications: portable and mobile.

Portable - Portable is a classification of equipment where the user, in general, will be within 20 cm of the transmitting antenna. Portable equipment is further broken down into two classes: within 2.5 cm of human contact and beyond 2.5 cm.

Note: Ankles, feet, wrists, and hands are permitted to be within 2.5 cm of the antenna even if the equipment is designated as being greater than 2.5 cm.

The AC4490 is not agency approved for portable applications. The OEM is required to have additional testing performed to receive this classification. Contact Laird for more details.

Mobile - Mobile defines equipment where the user will be 20 cm or greater from the transmitting equipment. The antenna must be mounted in such a way that it cannot be moved closer to the user with respect to the equipment, although the equipment may be moved.

Embedded Wireless Solutions Support Center:

www.lairdtech.com/ramp

27

© Copyright 2016 Laird. All Rights Reserved

Americas: +1-800-492-2320
Europe: +44-1628-858-940
Hong Kong: +852 2923 0600

Note:	Ankles, feet, wrists, and hands are permitted to be within 20cm of mobile equipment.

OEM Equipment Labeling Requirements

WARNING: The OEM must ensure that FCC labeling requirements are met. This includes a clearly visible label on the outside of the OEM enclosure specifying the appropriate Laird FCC identifier for this product as well as the FCC notice below. The FCC identifiers are listed above.

> Contains FCC ID: KQLAC4490-100 / KQLAC4490 / KQL-4x90200
>
> The enclosed device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) This device must accept any interference received, including interference that may cause undesired operation.

Label and text information should be in a size of type large enough to be readily legible, consistent with the dimensions of the equipment and the label. However, the type size for the text is not required to be larger than eight point (8 pt).

Antenna Requirements

WARNING: This device has been tested with an MMCX connector with the above listed antennas. When integrated into the OEM's product, these fixed antennas require professional installation preventing end-users from replacing them with non-approved antennas. Antenna Y2283 and SG101N915 strictly require professional installation. Any antenna not in the previous table must be tested to comply with FCC Section 15.203 for unique antenna connectors and Section 15.247 for emissions. Contact Laird for assistance.

Caution:	Any change or modification not expressly approved by Laird could void the user's authority to operate the equipment.

Warnings Required in OEM Manuals

WARNING: This equipment has been approved for mobile applications where the equipment should be used at distances greater than 20 cm from the human body (with the exception of hands, feet, wrists, and ankles). Operation at distances of less than 20 cm is strictly prohibited and requires additional SAR testing.

Channel Warning

The OEM must prevent the end-user from selecting a channel not approved for use by the governing body in the country in which this product is implemented

APPENDIX I: 5V TO 3.3V LEVELS

All inputs on the AC4490-200 & AC4490-1000 are weakly pulled High via 10 kohm resistors. The AC4490-200 has 5 V inputs while the AC4490-1000 & AC4490-1x1 have 3.3 V inputs. The AC4490-200 uses an octal buffer to drop the 5 V to the required 3.3 V level; the -1000 and -1x1 leave this to the OEM.

Some of the most common voltage conversion methods are described below.

Voltage Level Conversion IC's

This is the easiest and most efficient method. Laird recommends the TI SN74LVC244A Octal Buffer/Driver. Inputs can be driven from either 3.3 V or 5 V systems, allowing the device to be used in a mixed 3.3/5 V system.
Figure 14: Voltage Level Conversion

Passive Resistor Voltage Divider

While a resistor voltage divider can successfully drop the 5 V to the required 3.3 V, it will draw static current at all times. Typically, this method is only suitable for one-way 5 V to 3.3 V conversion. When choosing the resistor values, one needs to include the radio's internal 10 kohm resistors on the input signals.

APPENDIX II: SAMPLE POWER SUPPLY

Below is a simple switching power supply that provides enough current to easily power any Laird OEM module. It utilizes low cost, off-the-shelf components that fit into a small area. This supply has an input voltage range of +6 volts to +18 volts and will output +3.4 volts at 1.5 amps.

Included is a Bill of Materials with manufacturer's name and part numbers, Schematic and a sample PCB Layout. It is important to follow the layout suggestions and use large areas of copper to connect the devices as shown in the layout. It is also important to hook up the ground traces as shown and use multiple vias to connect input and output capacitors to the bottom side ground plane.

If the input voltage is less than 12 volts, C1 and C2 can be replaced with a single 100µF 20 volt capacitor (same part number as C7). This will reduce board space and costs further. If you are powering an AC5124 module, R1 can be changed to a 373 ohm 1% resistor. This will change the output to +5 volts at 1.0 amps.

Bill of Materials
